Other examples...

The honour of being the first to design a geodesic structure goes to **Dr. Walter Bauersfeld**, chief designer at the **Carl Zeiss Optical Works in Jena in 1922** at the time called '**The Wonder of Jena**'.

This structure formed the shell of the Zeiss Planetarium. 25 more were built including one in Chicago in 1930.

Source: Carl Zeiss Archive

Did You Know...

...that the World's First Planetarium Was Erected on the Roof of the ZEISS Factory?

The first artificial night sky was shown in Jena in the summer of 1923. 10 years earlier, Heidelberg astronomer Max Wolf had suggested the planetarium idea to Oskar von Miller, founder of the Deutsches Museum in Munich. He, in turn, approached Carl Zeiss Jena. After an interruption caused by World War I and a whole host of design issues, **Walther Bauersfeld, Chief Engineer at ZEISS**, developed Model I, which was tested in a specially built, 16-meter dome on the roof of the factory in Jena. Beginning in August 1924, presentations were also offered to the public. The very first projector was in service at the Deutsches Museum from 1925 to 1960, and it continues to be on display to this day.

Some decades later
Richard Buckminster
“Bucky” Fuller, an American
architect, engineer and
visionary thinker
popularized the special
structure of the geodesic
dome throughout the
world.

According to his plans,
a geodesic dome was
designed to cover the
American pavilion for the
World Fair in Montreal in
1967.

The building is still can
be seen.

Its diameter is 80 m and it is 65 m high.

The Greek word *Geodos* is meaning Earth.

“Geodesic” means Earth-like...

"Spaceship Earth," the AT&T Pavilion at Epcot in Disney World, Florida.

The People's Meeting Dome by Tejlgaard & Jepsen, Denmark

Nature House, a gorgeous geodesic dome home located on the Sandhornøya island of northern Norway.

A geodesic dome is a spherical or partial-spherical shell structure or lattice shell based on a network of great circles (geodesics) on the surface of a sphere.

The geodesics intersect to form triangular elements that have local triangular rigidity and also distribute the stress across the structure.

(Cf. http://en.wikipedia.org/wiki/Geodesic_dome).

The construction of Fuller's geodesic dome is based on the geometric shape, called **icosahedron**.

If you take a closer look at the figure, you can see that each edge of the icosahedron is of the same length, triangles being components of the structure are equal in size.

The icosahedron is composed of 20 identical equilaterals and a sphere can be circumscribed around the structure.

Features concerning the edges of the geodesic dome are denoted by the frequency number.

The construction of Fuller's geodesic dome is based on the geometric shape, called **icosahedron**.

The icosahedron is composed of 20 identical equilaterals and a sphere can be circumscribed around the structure.

Features concerning the edges of the geodesic dome are denoted by the frequency number.

Because of the equal length of edges the frequency number of a geodesic dome generated from a regular icosahedron is 1.

Material Setting

Introduction of 4D Frame

For Free Imagination and Infinite creativity

The Brand : 4D Frame

- ❖ The 4Dframe educational modelling kit is based upon the analysis of building techniques utilized in the construction of Korea's traditional, wooden buildings, in which no any nails have been used.
- ❖ 4Dframe has been proved to be a very appropriate tool for developing various skills in the transdisciplinary framework of STEAM learning.

6-way connectors : 380pcs

**Some Explanation about
Mathematical structure
for constructing Geodesic Dome**

Understanding the structure of Geodesic Dome for connecting frames

Above triangular side part has 5 symmetric shapes congruent to the letter-wise symbolized figure part on the above figure. It means that if you understand the connecting structure on the forepart, then the remaining part for connecting can be done similarly.

These two curved-line triangles are congruent to each other. Also in-side connecting structures are exactly same. The center vertex(red point) of the top pentagon has 5 congruent curved-line triangles and can be covered by these 5 triangles exactly. It means that by the rotation of 72 degree, these curved-line triangle are same in the Geodesic-dome. Similarly, other 3 curved-line triangle can be obtained by the rotational transformation more.

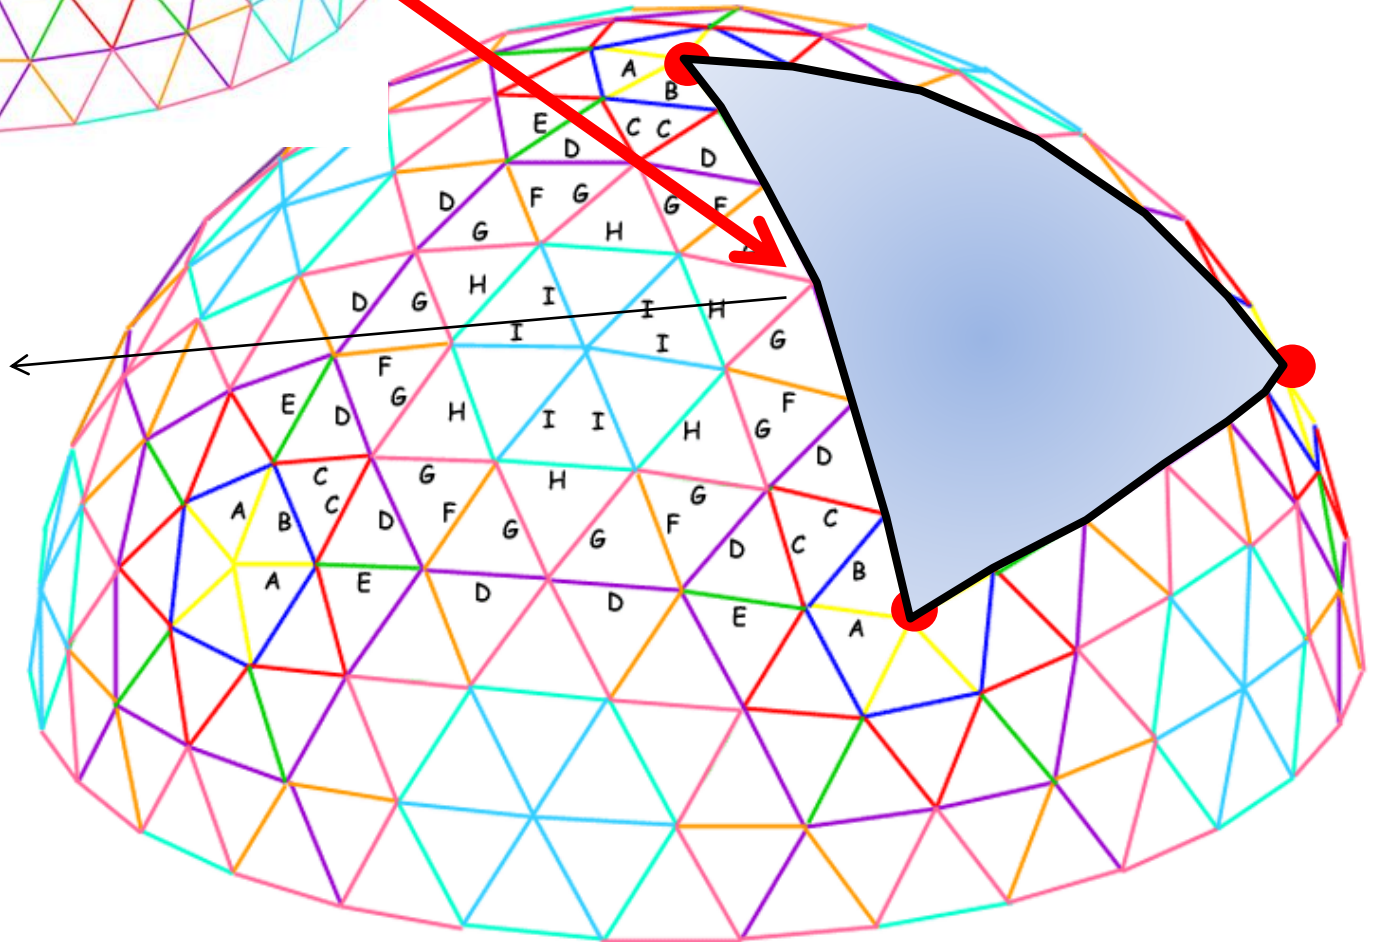

A curved-line triangle

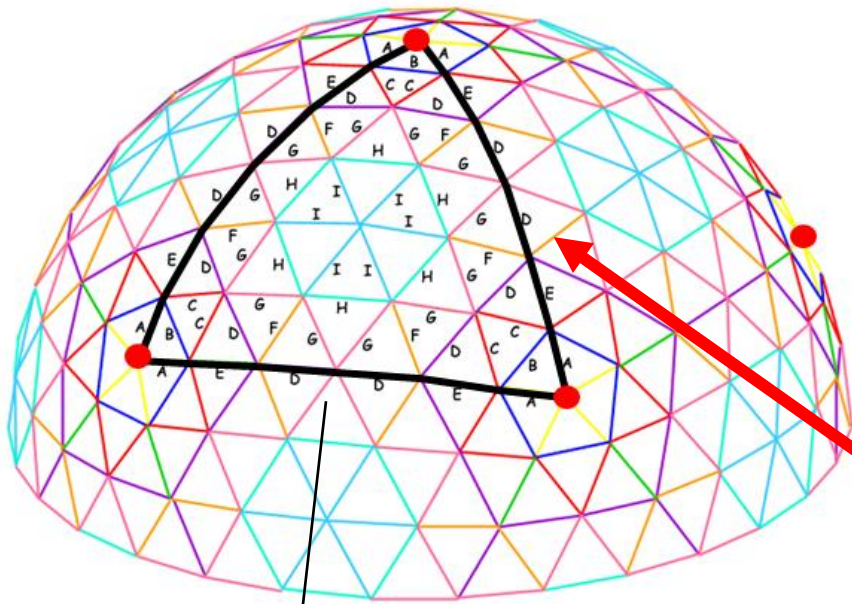

A curved-line triangle

Inside part of the below shaded region have the same connecting structure with that of left curved-line triangle. This means that we can type the order of the letter on each sides inside of the below shaded region.

Therefore the result of naming letters over sides are shown like the below dotted triangle.

A curved-line triangle

Congruent triangular part
Of curved-line triangle

These all yellow-shaded region(curve-line triangle) are congruent to each other by adequate transformation (flip, or 72 degree rotation,

These all yellow-shaded region(curve-line triangle) are congruent to each other by adequate transformation (flip, or 72 degree rotation,

These all yellow-shaded region (curve-line triangle) are congruent to each other by adequate transformation (flip, or 72 degree rotation,

These two blue-shaded region(curve-line triangle) are congruent to each other by adequate transformation

These two blue-shaded region(curve-line triangle)) are congruent to each other by adequate transformation

If we summarize congruent information about letters on each side over ONE PART AMONG OF 5 congruent surrounding parts of Geodesic Dome

CONCLUSION

If you see the below region, 72 degree rotation can make us fix which letters on the corresponding sides have been written. It means that even though we cannot see the other face on Geodesic Dome, by our moving by 72 degree rotation, information about connecting letter (on each sides) over other faces can be induced by this rotation.

Constructing Geodesic Dome

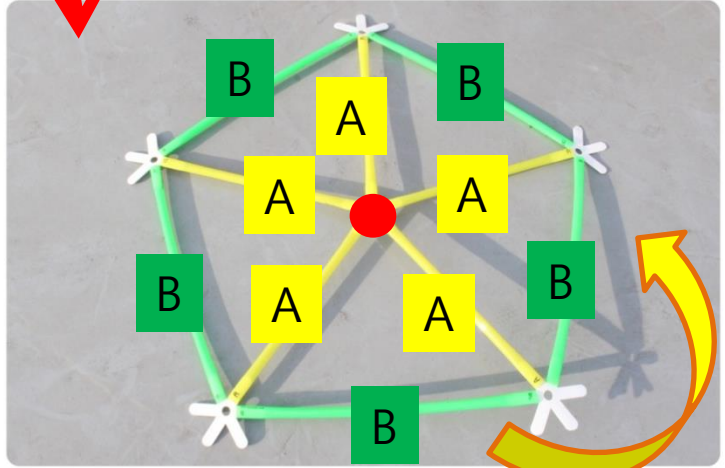

**TOTAL CONSTRUCTION
PROCESS OF
GEODESIC DOME**

Top part Pentagon

Top part pentagon

Side part 5 pentagons

- Top part pentagon

Top part pentagon

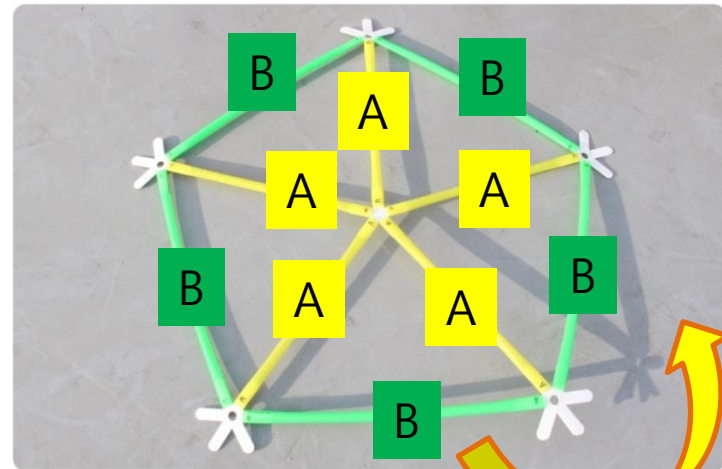

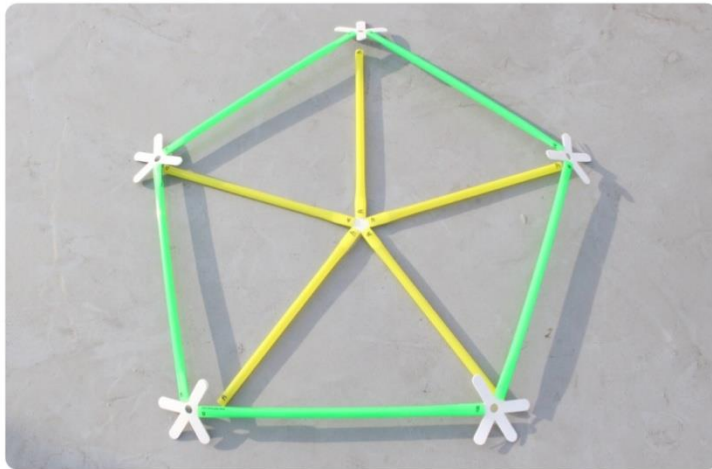

This is top part pentagon building. As you see, the red part shows **two-pieces folding in connecting**. Depending on the number of connecting frame over each vertex, way-connectors should be determined as shown in the suggested figure beforehand.

Taping method at each vertex

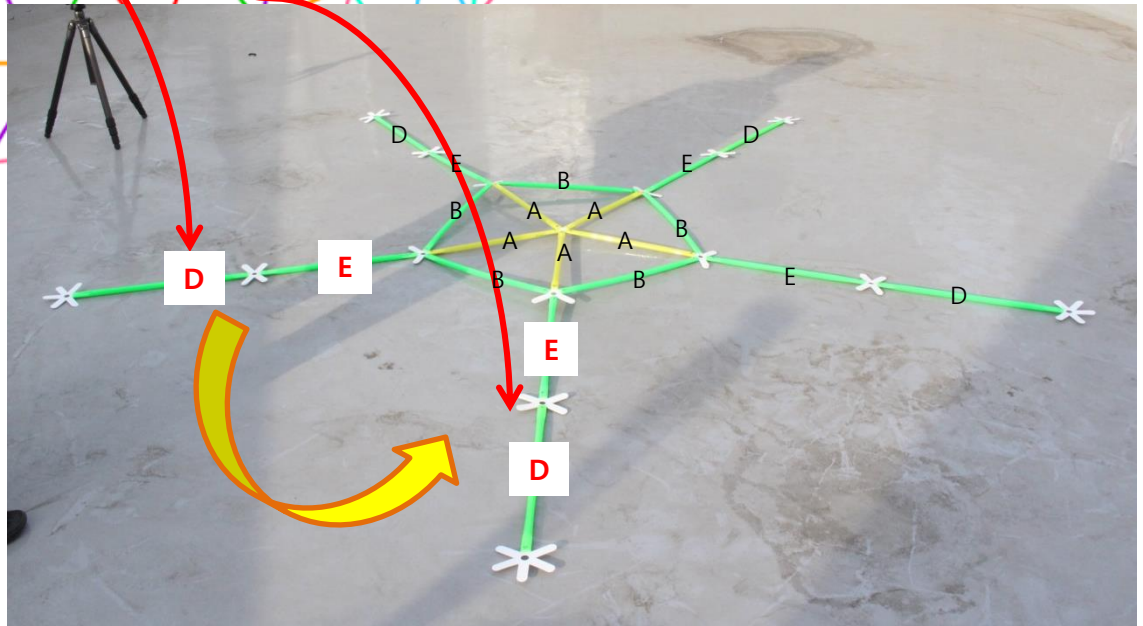

* You should use duct tapes each connector

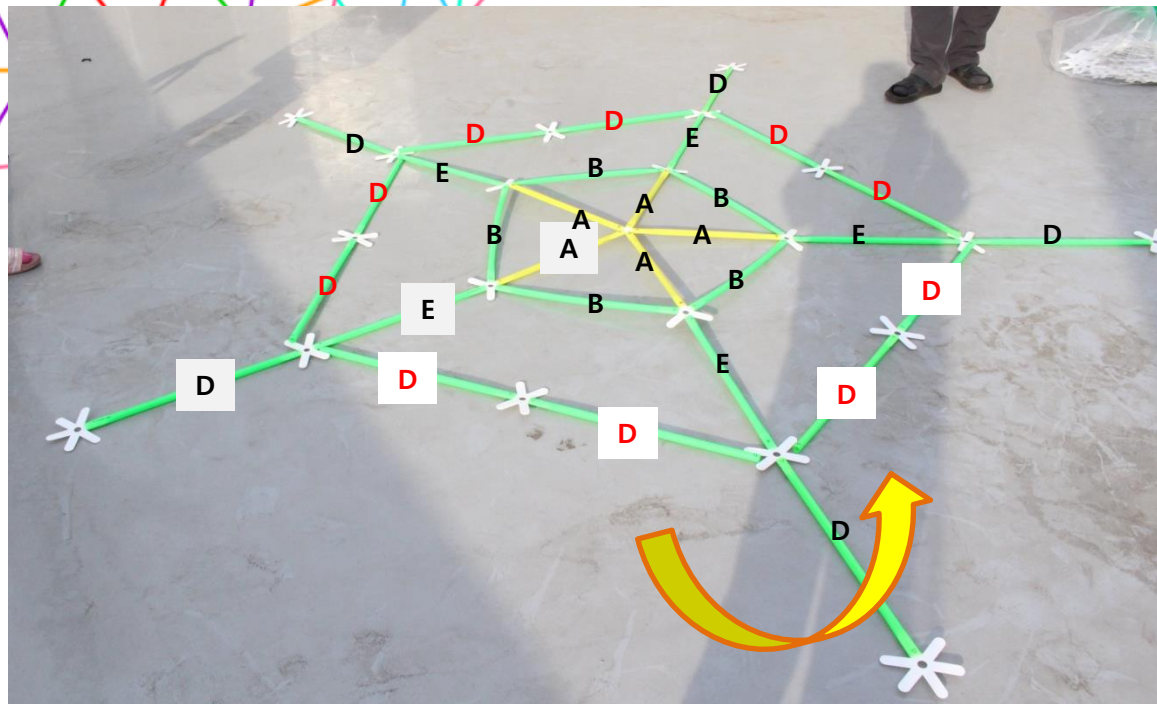

Process of connecting

This is top part pentagon building. Inside 5 way connector is used and 6-way connectors has been Used on the 5 sides-boundary. Please use two times-taping in center of pentagon.

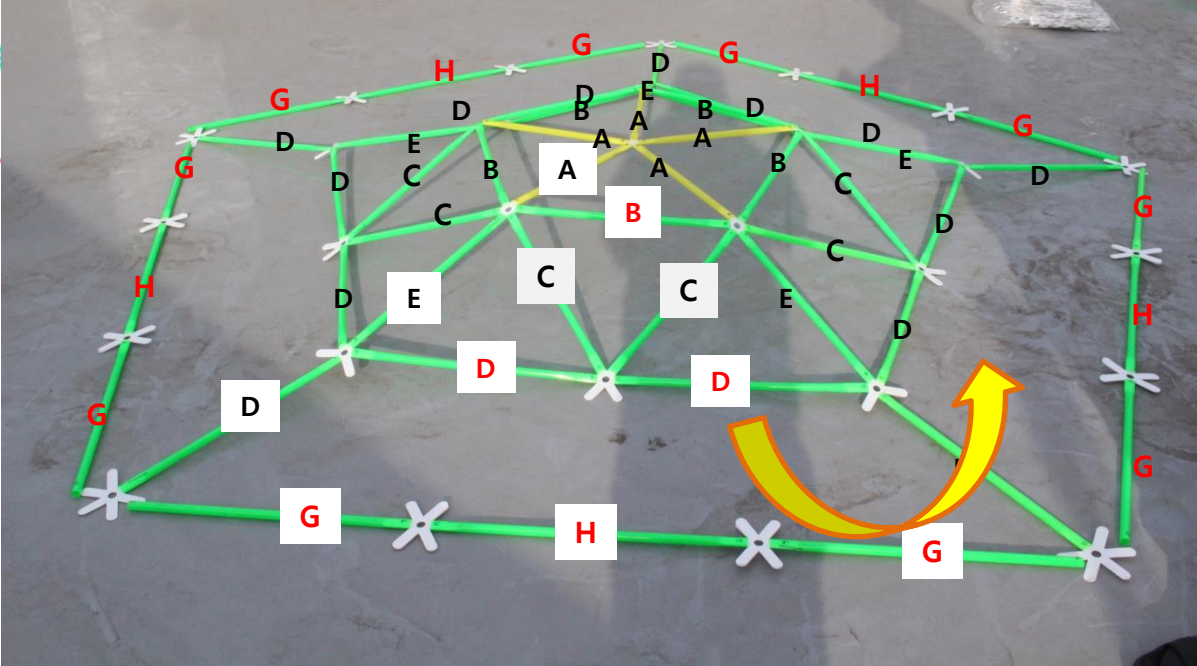

Each side parts have the 5 symmetric shapes congruent to the letter-wise symbolized figure part on the above figure. It means that if you understand the connecting structure on the forepart, then the remaining part for connecting can be done similarly.

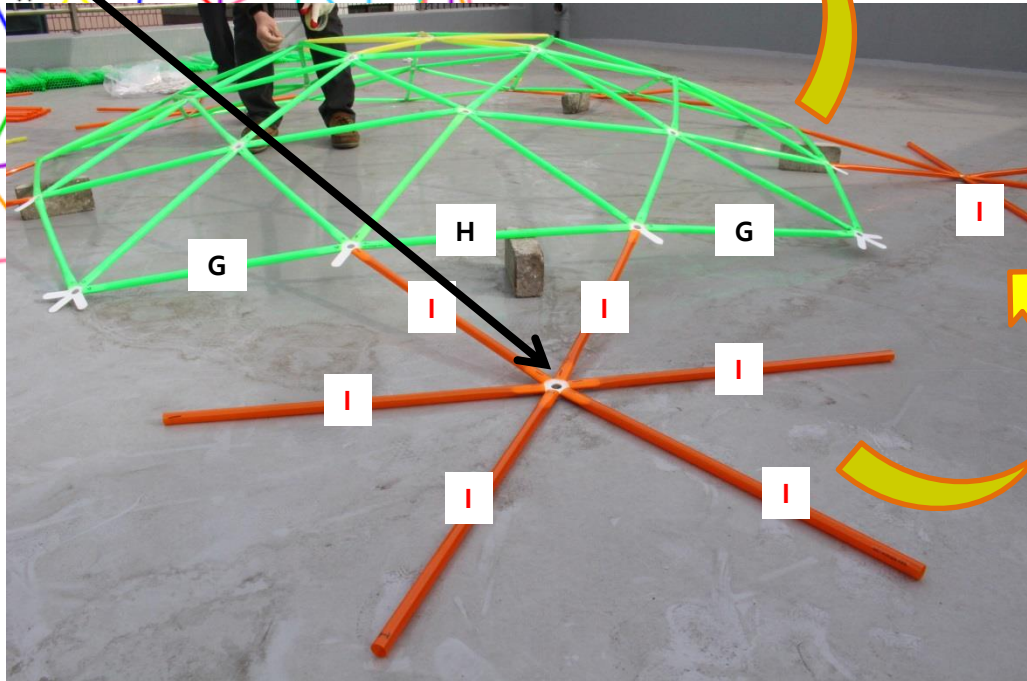

72 Degree Rotation by the AXIS of Geodesic Dome at the center of Top Pentagon

Proceed to connect
By this method

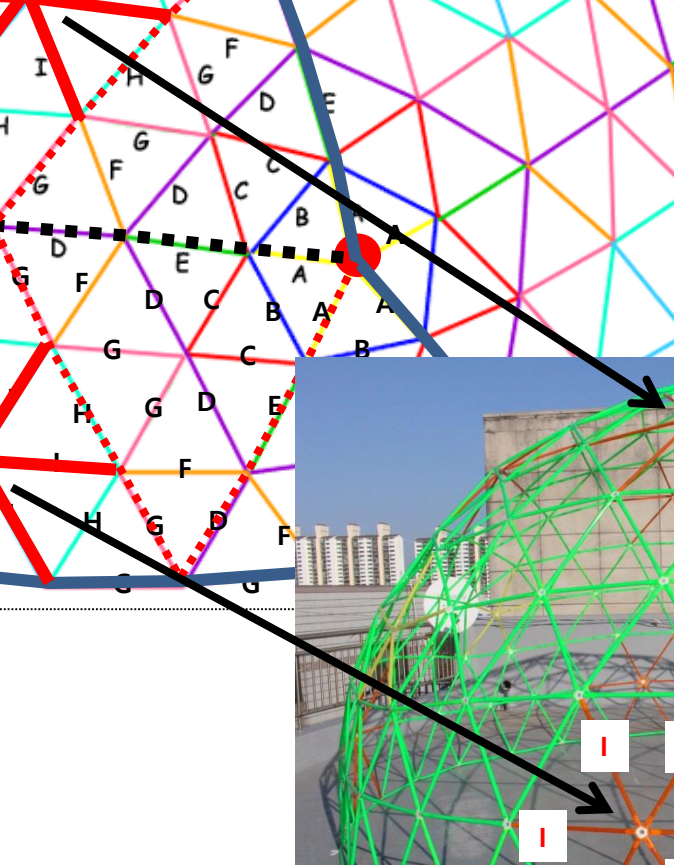

CONCLUSION

Further process

For extra activities inside of dome, please MAKE some small entrance ROOM after eliminating some part of frames under environment.
